

Write a SELECT query to retrieve all columns from a 'customers' table, and modify it to return only the customer's name and emailaddress for customers in a specific city.

```
create table customer(  
id number (10) primary key,name  
varchar2(20),  
email address varchar2(20),  
location varchar2(20)  
);  
  
insert into customer values(5, 'ee', 'ee@gmail.com', 'KA');  
  
select * from customer;  
  
select name, location  
from customer where  
location='TN';
```
